

Billroth II 式使用圆形吻合器吻合法 Pyloric partial resection: Billroth II with circular stapler

使用圆形吻合器时，如果选用的钉砧头的外径大于空肠内径的话，则有可能缝入对侧的肠管壁，所以一定要十分注意。对日本人而言，通常选用外径为25mm的圆形吻合器较为合适。

When using a circular stapler, if the outer diameter of the anvil is larger than the inner diameter of the jejunum, the intestinal wall of the opposite side may be stapled, so caution should be taken. Generally, the circular stapler with a 25 mm outer diameter is most frequently used in Japanese patients.

吻合部也可取在残胃后壁。此外，吻合线即使位于胃大弯侧也无妨。

The anastomosis site can also be made on the posterior gastric wall. It will not cause problems, even if the stapling line is on the greater gastric curvature.
